

For this project in the beginning, Michael was mainly responsible for backend development and creation of queries to retrieve and add data to the database. David was mainly responsible for frontend development to create the site itself, such as the placement and design of the forms and buttons. However, as the project went on, we each took up individual tasks depending on what still had to be done, both backend and frontend. There is no specific split between responsibilities as we both decided to work on what needed to be done or fixed. We used GitHub to keep track of the code and seamlessly integrate what we each did together through merges, so we could also test what each person did for bugs and edge cases. By doing individual testing on our own, we could put in information in our own unique databases to test out different scenarios.

### Main Responsibilities

#### Michael

- Backend development
- SQL Queries
- Information retrieval
- Bug testing and edge cases

#### David

- Frontend development
- Website structure and design
- Use cases and documentation
- Bug testing and edge cases
